AIR HEATERS, INDIRECT FIRED (VENTED)

An indirect fired heater uses a heat exchanger where the heat source is contained in the unit. A fan blows over the outside of the heat exchanger, redirecting heat away from the unit and out into the area to be heated. This type of heater is most effective with recirculation, but it can also be used in a pressurization setup. They produce clean air without emitting carbon monoxide, which improves working conditions. Indirect heaters do not generate moisture, so completed work at the jobsite is not affected.
